

MARRIAGE AND THE FAMILY

83

Independent of their being instruments of power, children enhanced the reputation of their fathers. The strength of a lineage and its vitality were highly valued in Ruanda. To have numerous offspring ensured that the group ancestors would be honoured, traditions maintained, and legends transmitted.

Ambition for power may be a very fitting pursuit for people who do not have to worry about fundamental human needs such as food, shelter, &c. For the Hutu, the ultimate value was security which was achieved by getting for oneself the protection of a member of the superior caste. To secure this protection, one had to become a client, and therefore to be able to supply a lord with services in labour and goods. Consequently, it was essential to produce a surplus and not only what was necessary for the subsistence of the people living in the compound. Surpluses could be obtained only by work, and children were very important in this respect. As in most peasant societies, they were useful when still quite young in helping their parents in their work. Moreover, as in the case of the Tutsi, offspring could bring supplementary protection and wealth to the compound by their ability to obtain cattle and connexions.

The preceding account might give the impression that for the Ruanda children were just means to their ultimate value of power, fame, security. This would be very misleading as they enjoyed having children simply because they liked children. This is not to question the genuineness of their affection for their offspring. I want only to stress here the social functions of children in this particular society.

Ruanda biological knowledge of the processes of procreation was extensive. They knew that a single ejaculation could produce pregnancy, that there is a relation between menstruation and fertility, that conception is not prevented during the suckling period, &c. According to their theories, the man's participation in conception was more important than the woman's. The analogy with the sowing of seeds in a field is commonly used by informants. It was pointed out to me that if it is indeed necessary for the seed to be buried in the soil, strength and vitality are unquestionably in the seed rather than in the passive ground.¹⁰

This last theory is important in that it gives a biological basis to the patrilineage principle of descent and to the difference between
